

## Classified Operations Oversight

### *Solution Brief*

---

Compartmentalized governance enforcement with cryptographic separation of information channels. Claviger operates under DoD 5220.22-M and NSA security protocols for classified AI systems.

**Information Compartmentalization:** Different AI systems are isolated in separate compartments. Intelligence from one compartment cannot leak to others. Claviger enforces these boundaries at the cryptographic level.

**Handling Protocols:** Classified information is subject to strict handling, transmission, and storage protocols. Claviger enforces these protocols automatically, preventing human error from causing security violations.

**Audit for Oversight:** Senior leaders need assurance that classified AI systems are operating under control. Claviger provides cryptographic proof of operational discipline without exposing classified details.

**Cross-Domain Solutions:** Claviger works within cross-domain transfer systems, providing governance at each data movement point without exposing classified content.
