

CMMI L5 Operations

Solution Brief

Process-optimized governance with real-time verification of all AI decision pathways. Claviger supports CMMI level 5 operations by creating the process instrumentation and evidence required for continuous process improvement.

Process Measurement: Every AI decision pathway is measured for cycle time, quality metrics, and compliance rate. This data flows into continuous process improvement discussions.

Process Variance Detection: When an AI system deviates from expected process, Claviger detects and alerts. This prevents unexpected variations from cascading into production issues.

Quantitative Improvement: The governance data generated by Claviger enables CMMI-style quantitative process improvement. Decisions are made based on operational measurement, not intuition.

Defect Prevention: By analyzing the governance logs, organizations identify recurring patterns and implement preventive controls before defects reach production.
