

## Compliance Evidence Generation

### *Solution Brief*

---

Automatic generation of regulator-ready compliance evidence from operational data, eliminating manual audit report construction. Every policy decision is cryptographically verified and flows into compliance documentation.

**Operational Memory:** Claviger creates an immutable operational memory of all governance decisions. This is hardware-anchored cryptographic evidence, not manually maintained audit logs.

**Zero Manual Construction:** Compliance briefs for SEC, FINRA, and banking regulators are generated automatically from operational evidence. No human-written narratives that can diverge from actual operations.

**Audit Response Time:** Regulatory audit requests that previously took 3 weeks to fulfill now require 2 hours. Evidence is already verified, organized, and formatted for submission.
