

Distributed Agent Governance

Solution Brief

Coordination and verification of 4,700+ AI agents operating at national scale. Claviger provides federated governance with local autonomy and central accountability across geographic boundaries.

Federated Policy Enforcement: Local agents operate autonomously within their region but are constrained by central policies. This enables regional adaptation while maintaining system-wide stability.

Coordination Without Central Bottleneck: Agents coordinate their decisions through cryptographic verification without funneling all decisions through a central point. This provides scalability and resilience.

Geographic Fairness: Resources are allocated fairly across regions despite local agents having different objectives. Central policies enforce equity even when local agents act independently.

National-Scale Accountability: Despite distributed operations across thousands of agents, the system maintains complete accountability. Every agent action is cryptographically verified and traceable.
